

Virtual Fence 101 for Rangeland Livestock

Andrew Antaya, Brandon Mayer, Carter Blouin, Sarah Noelle, Brett Blum, Aaron Lien, Joslyn Beard, Jose Soto, Amber Dalke, Hector Elias Justiniani and George Ruyle

What are Virtual Fences?

Geographic boundary that is programmed into an electronic device, typically a *collar* worn by livestock

Virtual Fence Terminology

Virtual Fence Collars

GPS determines animal's geographic location

Trains animals to stay within areas by auditory and electrical cues

Transmits data to the Internet via radio or cellular network

Electronics
Housing

Optional Large
Animal Bridge

Optional Webbing
Bridge

Standard Chain
Bridge

Note: Chain always loops through the bridge and clips back on itself with the carabiner. Do not clip carabiner directly to bridge.

Solar cells

A tough, durable collar with solar panels. Surface scratches will not have a noticeable impact on their efficiency.

Rechargeable battery

While on pasture, the batteries charge using the solar panels. The batteries will last the longest on large, sunny pastures with excellent cell phone coverage.

Bluetooth

Captures signals from shelter beacons, deactivates GPS when the animals are in shelter, locating a collar if you have no cell phone coverage.

Motion sensor

Registers acceleration along three axes, saves energy, and is the basis for further development to provide valuable information about the animal's condition.

Mobile network

The collars use the 2G and 4G networks to communicate with our app. In order to create pastures, receive notifications etc, there must be cell phone coverage on pasture.

GPS-receiver

Nofence uses satellite signals from American GPS and Russian GLONASS to determine its position.

DIY Mobile Base Station Conversion Guide Materials and Step by Step Instructions

How to convert a stationary base station provided by Vence Corp into a mobile base station. Your conversion may look different depending on the type of trailer you use with your conversion.

Disclaimer! The content of this document accurately represents how we have successfully approached increasing the portability of virtual fence base stations, but users should undertake any modification of a base station at their own risk. Vence Corp base stations are not designed to be mounted on a trailer and sensitive equipment could be negatively affected by the consequences of transport. Thus, Vence Corp's product warranty will not cover any damages to the base station resulting from the effects of trailer-mounted transport. Check with your individual equipment supplier for recommendations and concerns.

Cost Comparison Tool

Currently in Beta Testing

Key Questions to Consider

1. How many collars?
2. Where and when can you collar?
3. How many base stations?
4. Where to place base stations?

Potential Applications

1. Improve Grazing Distribution

2. Fence Areas with Minimum Cost and Maximum Flexibility

- avoid toxic/noxious weeds
-

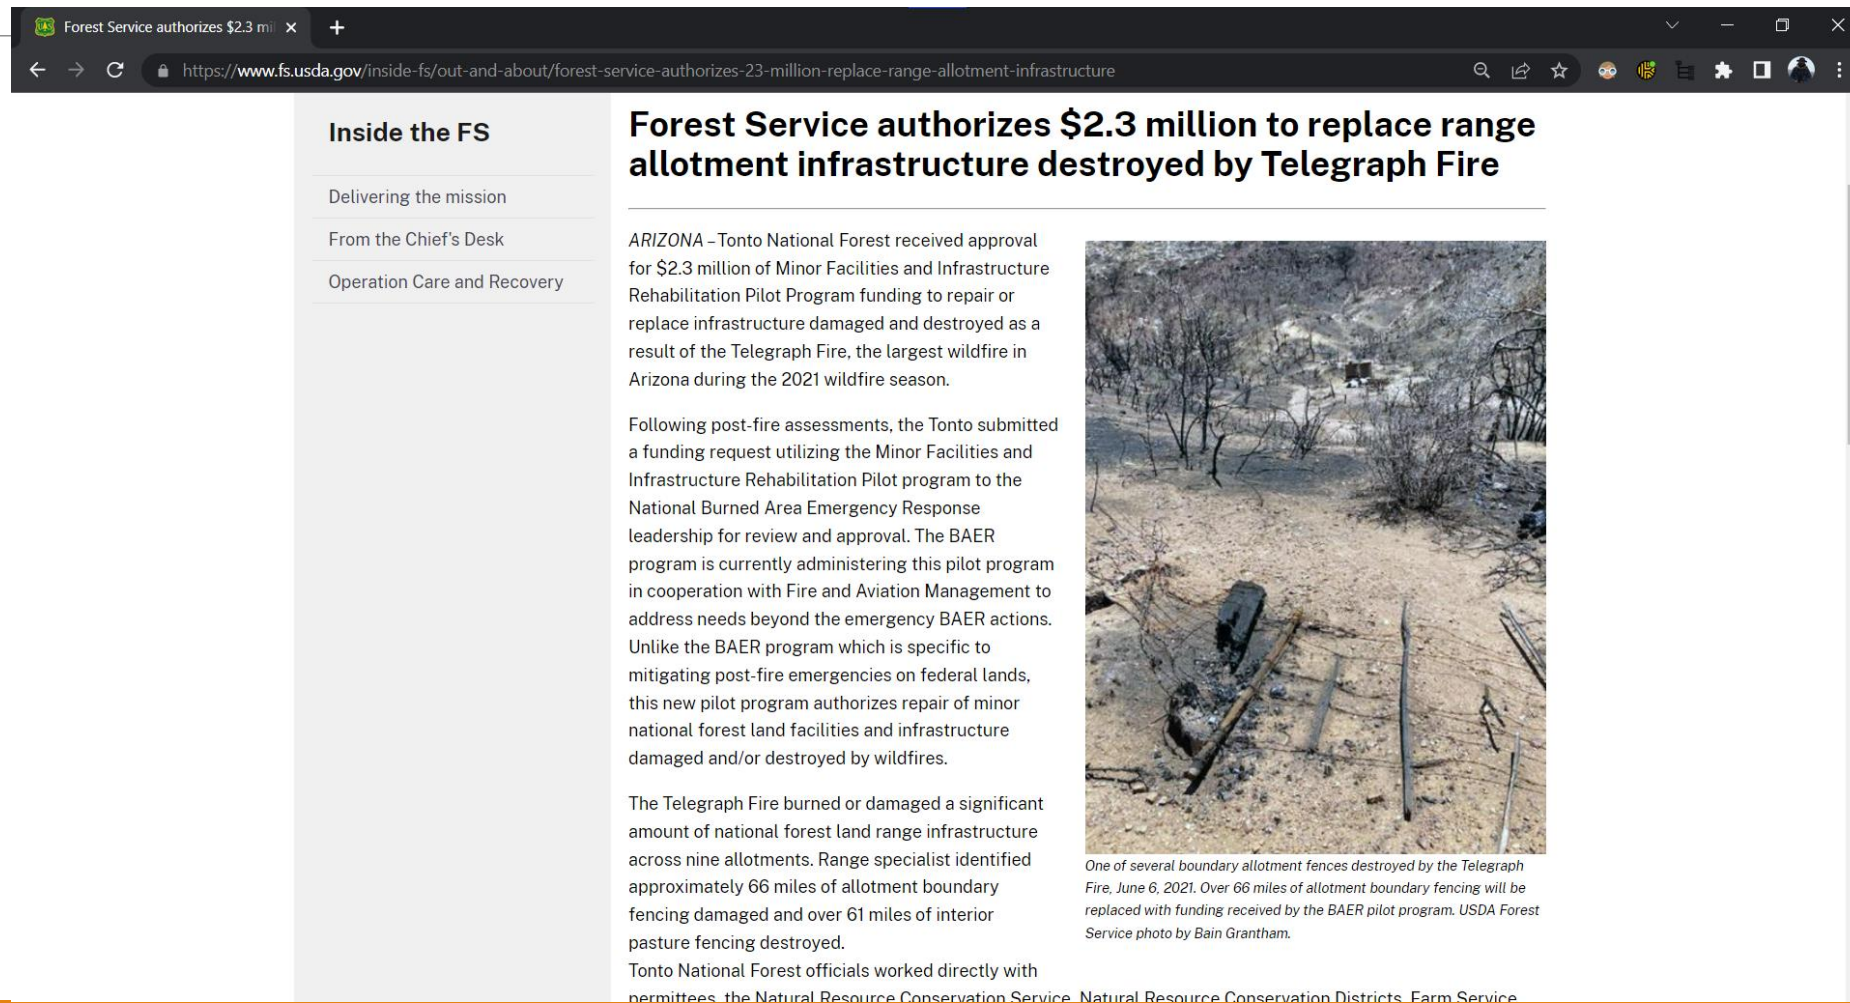

3. Post-Fire or Disturbance

- partially burned allotments – let the burned area recover and graze the un-burned area

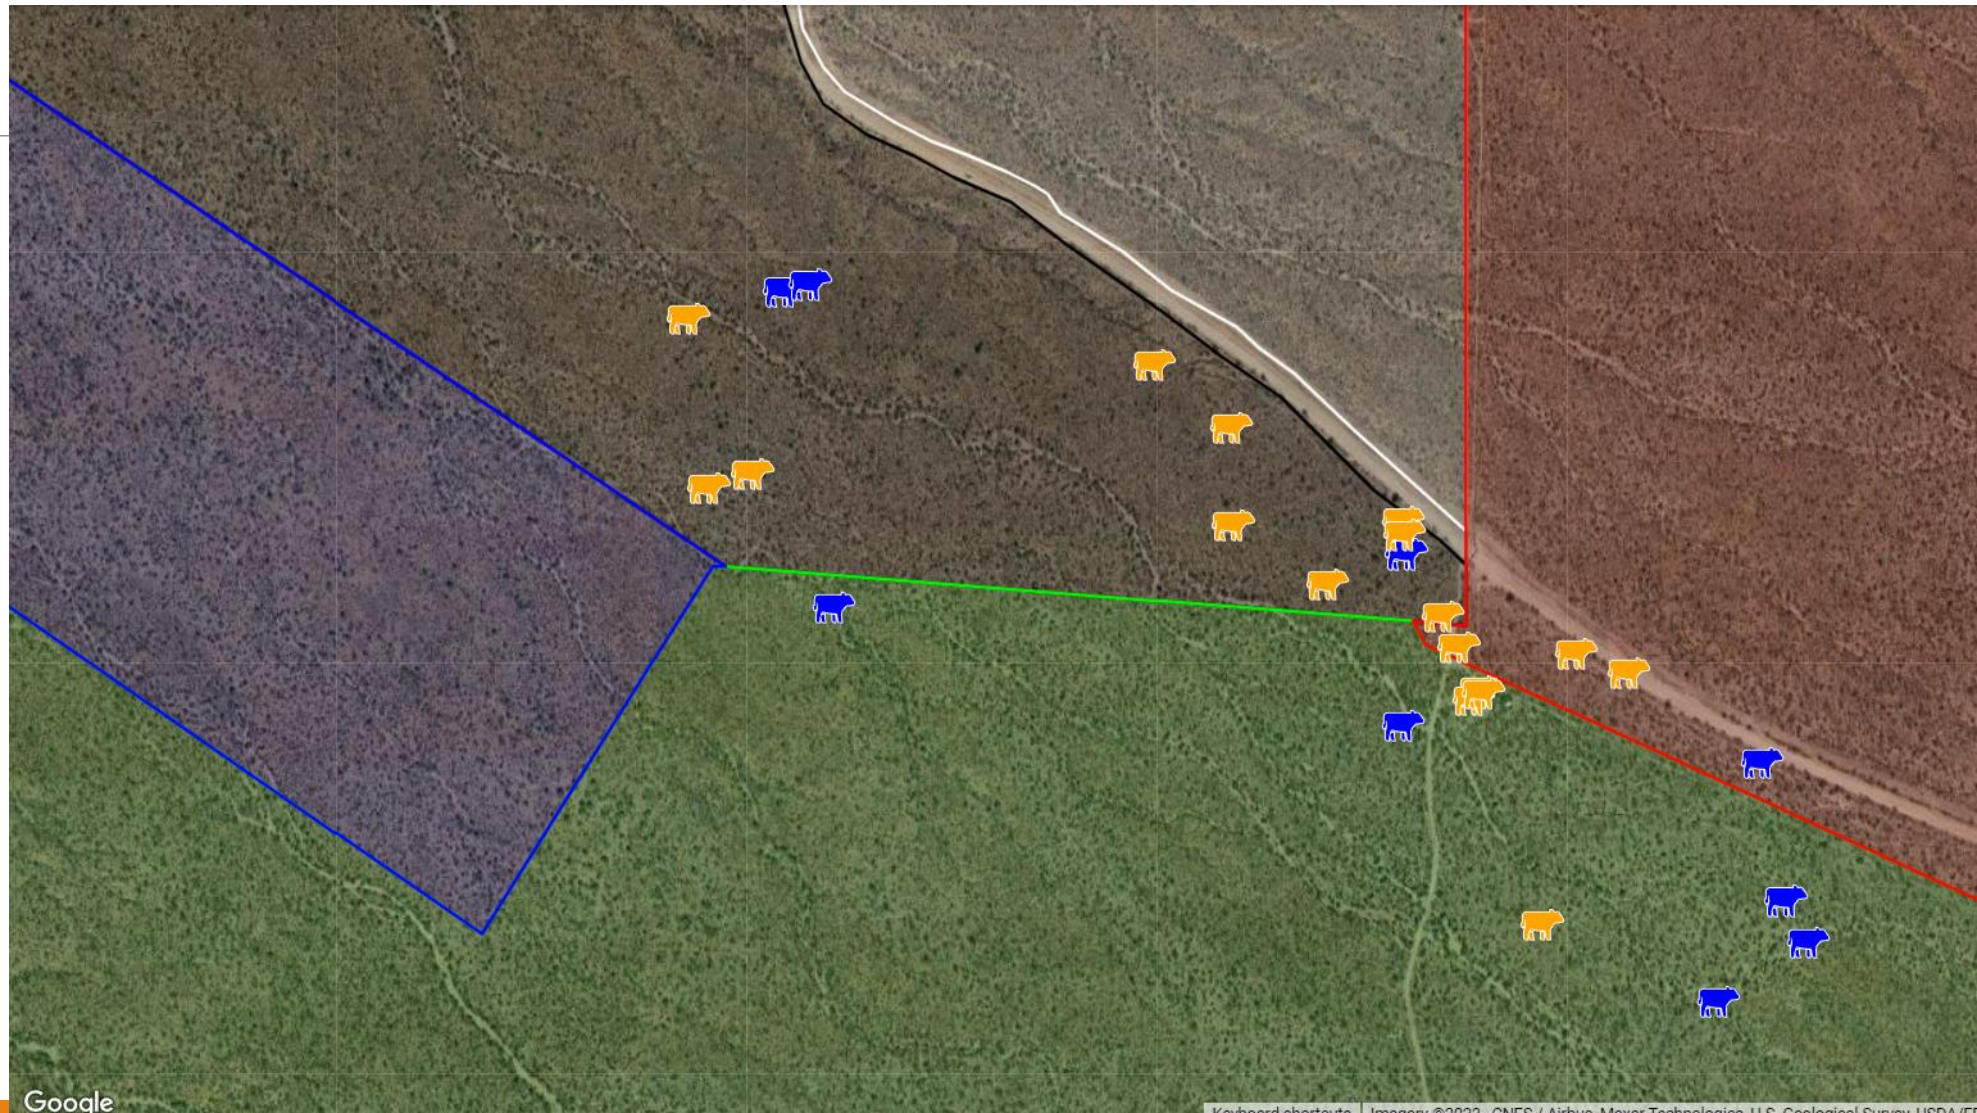

4. Supplement Existing Fences

- buys you time to make repairs

The screenshot shows a web browser window with the URL <https://www.fs.usda.gov/inside-fs/out-and-about/forest-service-authorizes-23-million-replace-range-allotment-infrastructure>. The page features a navigation menu on the left with the following items: "Inside the FS", "Delivering the mission", "From the Chief's Desk", and "Operation Care and Recovery". The main content area has a headline: "Forest Service authorizes \$2.3 million to replace range allotment infrastructure destroyed by Telegraph Fire". Below the headline is a paragraph: "ARIZONA - Tonto National Forest received approval for \$2.3 million of Minor Facilities and Infrastructure Rehabilitation Pilot Program funding to repair or replace infrastructure damaged and destroyed as a result of the Telegraph Fire, the largest wildfire in Arizona during the 2021 wildfire season." This is followed by a longer paragraph: "Following post-fire assessments, the Tonto submitted a funding request utilizing the Minor Facilities and Infrastructure Rehabilitation Pilot program to the National Burned Area Emergency Response leadership for review and approval. The BAER program is currently administering this pilot program in cooperation with Fire and Aviation Management to address needs beyond the emergency BAER actions. Unlike the BAER program which is specific to mitigating post-fire emergencies on federal lands, this new pilot program authorizes repair of minor national forest land facilities and infrastructure damaged and/or destroyed by wildfires." A third paragraph states: "The Telegraph Fire burned or damaged a significant amount of national forest land range infrastructure across nine allotments. Range specialist identified approximately 66 miles of allotment boundary fencing damaged and over 61 miles of interior pasture fencing destroyed." The final paragraph begins: "Tonto National Forest officials worked directly with permittees, the Natural Resource Conservation Service, Natural Resource Conservation Districts, Farm Service" and is cut off. To the right of the text is a photograph of a charred landscape with a destroyed fence. Below the photo is a caption: "One of several boundary allotment fences destroyed by the Telegraph Fire, June 6, 2021. Over 66 miles of allotment boundary fencing will be replaced with funding received by the BAER pilot program. USDA Forest Service photo by Bain Grantham."

5. Easier to Locate and Gather Cattle!

6. Riparian Exclusion
